(54) Title: **FOIL DISPLAY WITH TWO LIGHT GUIDES**

(57) Abstract: A display device is described, which comprises a movable element (17) and selection means (15,16) for locally bringing the movable element into contact with a selected one of two light guides (11,12), arranged on either sides of the movable element. This provides an essentially symmetric display device, with one light guide on each side of the movable display can display information in two directions, and the selection means can be controlled in a suitable way to activate selected portions of the guides. The invention can be used to provide a bi-directional display.
